For Immediate Release:

Smart Solutions Now Offering Energy Efficient Control Systems to Hospitality Industry and Educational Facilities

June 8, 2009, Birmingham, AL— Smart Solutions announces new green solutions for the Hospitality Industry and Educational Facilities. For the last four years, Smart Solutions has been making homes more energy efficient through home automation and now is focusing their expertise to help businesses and schools go green too.

Owner Kevin Braswell said “Our focus on the Hospitality and Educational markets adds to our commitment to deliver technology solutions that provide energy savings. For instance, in 2008, the Hospitality Industry spent more than 6 billion dollars on energy costs in the United States - over 60% of which went to heating and cooling. We now have a way to help manage those costs. In fact we can reduce energy costs by as much as 40%. The systems typically pay for themselves within 5 years.”

After a great deal of product research and planning, Smart Solutions now provides both basic and enterprise control of energy management.

Basic energy management provides a cost effective approach for curbing energy usage. Sensors similar to those used in security systems can determine whether the room is occupied and adjust the HVAC and lighting accordingly. The system also manages Audio/Video components.

Enterprise control builds upon the basic energy system by adding centralized facility management that provides real time status and energy reporting capabilities. “With an enterprise solution, property managers have the ability to benchmark and track their power consumption by each individual room to identify areas of high energy consumption” said Braswell.

About Smart Solutions:

Founded in 2004 by Kevin Braswell, Smart Solutions is a green technology company specializing in price-to-functionality benefits. They offer turn key energy management packages, and also create customized solutions to fit specific needs.
